

We were interested, that compared to other LNB's in Europe, how strong the general parameters of Econ LNB's are. The measurement results are not Authentic results.

Condition of measurement: The test made with Satlook Micro HD measuring instrument and 60cm Corab satellite dish. Conditions of experiments with different types of LNB's were absolutely the same. From one type (single, twin, quad) the time elapsed between the first and the last time of measurement results was maximum 30 minutes.

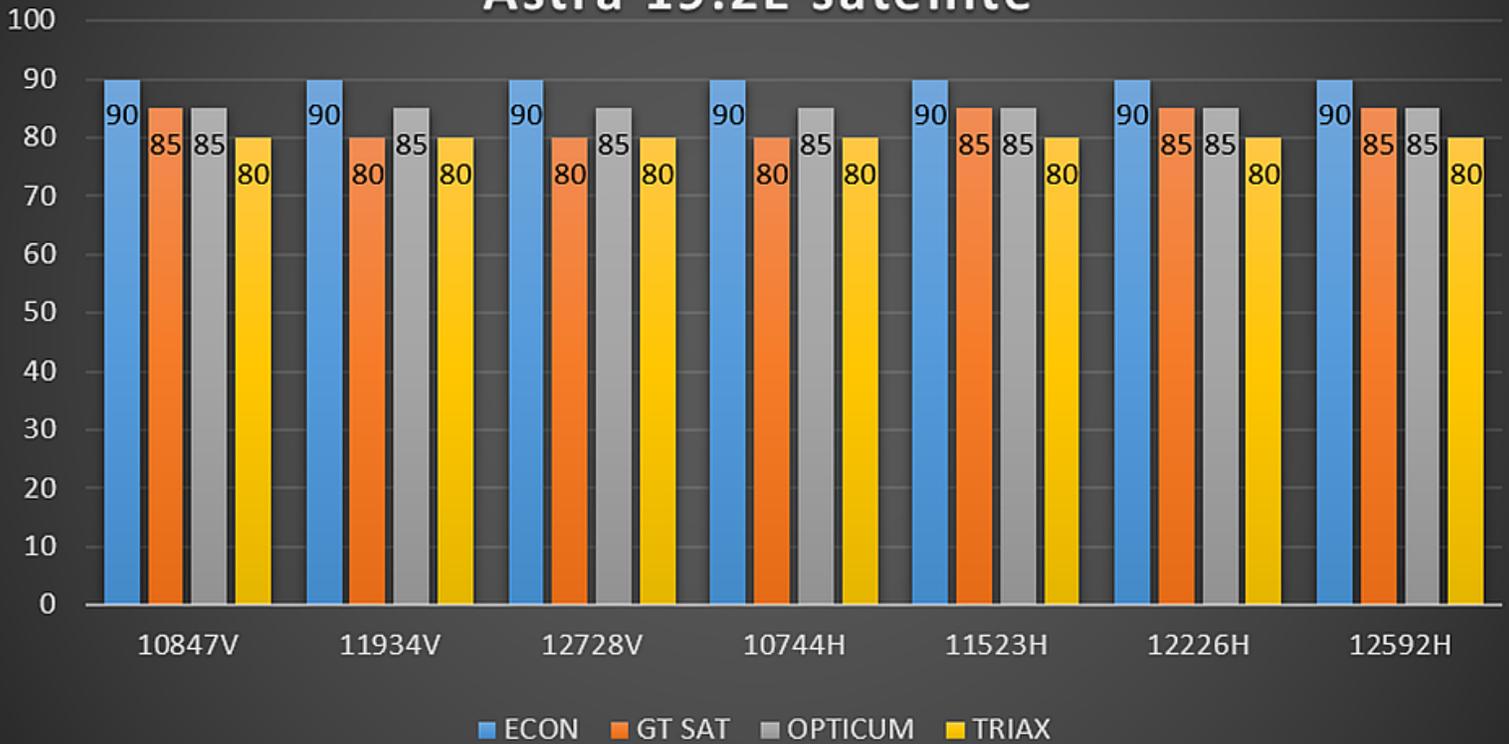

### compare of Quad LNB's SNR parameter on Astra 19.2E satellite

### ASTRA 19,2 satellite

	10847V	11934V	12728V	10744H	11523H	12226H	12592H	11509V
